Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                a
                                                                                                                                                                                                                                                                                                                                                                  The present sequence encodes human activation-induced cytidine deaminase
(AID). AID structurally relates to an RNA editing enzyme APOBEC-1 and
has cytidine activity similar to APOBEC-1. AID has antiallergic,
antianaemic, antiasthmatic, ophthalmological, anti-HIV and
dermatological activities, and can be used in gene therapy. AID
colourcleotides are useful in methods for identifying drugs for the
treatment of B cell associated immune system disorders, immunodeficiency
diseases and allergies, such as immunoglobulin A (IgA) deficiency
disease, IgA nephritis, gamma-globulinaemia, atopic dermatitis, allergic
colitis, asthma, food allergy, drug allergy, allergic rhinitis, Rosen
colitis, asthma, food allergy, drug allergy, allergic rhinitis, Rosen
immunodeficiency disease, ataxia telangiectasia, common variable
colitis and IgG subclass selection disorder. The DNA sequences
IgE disorder, and IgG subclass selection disorder. The DNA sequences
concoding AID may be used for gene therapy and the antibodies to the AID
